# SEO AUDIT AND WEBSITE OPTIMISATION

## SEO Practical Project

**Aarohi Ethnic Wear**

https://pramyashree444.github.io/aarohi-ethnic-wear/

Prepared by: P. Ramyasri

Project Type: Self-Initiated Practice Project

## PROJECT OVERVIEW

My project is based on a fictional women's ethnic-wear brand called Aarohi Ethnic Wear. I created this website as a practical learning project to gain hands-on experience in SEO and digital marketing. I used the website to practice different SEO techniques and work with digital marketing tools. The website was built using HTML and hosted through GitHub Pages. It contains eight main pages: Home, Sarees, Kurtis, Dresses, Lehengas, About, Blog and Contact.

## WEBSITE DETAILS

| Field | Details |
|---|---|
| Website Name | Aarohi Ethnic Wear |
| Website URL | https://pramyashree444.github.io/aarohi-ethnic-wear/ |
| Website Type | Static Practice Website |
| Technology Used | HTML |
| Hosting Platform | GitHub Pages |
| Number of Main Pages | 8 |

## SEO PROJECT OBJECTIVES

1. To understand how SEO helps improve a website's visibility in search engines.
2. To conduct keyword research using Google Trends and map relevant keywords to website pages.
3. To optimise website titles, meta descriptions, headings and page content.
4. To perform a technical SEO audit using Screaming Frog and identify issues related to crawling, indexing and website structure.
5. To monitor website indexing and search performance using Google Search Console.
6. To evaluate website performance using Google PageSpeed Insights.

7. To install Google Analytics 4 and understand basic website traffic and engagement reports.

## SEO TOOLS USED

| TOOL NAME | PURPOSE | WORK PERFORMED |
|---|---|---|
| Google Trends | Explore search interest and identify keyword opportunities | Compared search terms related to women's ethnic wear in India and reviewed rising queries. |
| Google Search Console | Monitor website indexing and Google Search performance. | Checked indexing status, sitemaps, search performance, URL inspection and website links. |
| Screaming Frog SEO Spider | Crawl a website and identify technical and on-page SEO issues. | Crawled the website and checked page titles, meta descriptions, canonical tags, status codes and readability. |
| Google PageSpeed Insights | Evaluate website performance and user experience. | Tested the website and reviewed Performance, Accessibility, Best Practices and SEO scores. |
| Google Analytics 4 (GA4) | Measure website traffic and user engagement. | Set up a GA4 property and web data stream, installed the tracking tag and reviewed Realtime, Traffic Acquisition and Landing Page reports. |

| | | |
|---|---|---|
| Google Keyword Planner | Discover keyword ideas and estimate search demand. | Explored the tool, but did not complete keyword research because the setup prompted for billing details. |
| GitHub Pages | Host the practice website online. | Published the Aarohi Ethnic Wear HTML website and updated website files through GitHub. |

## Keyword Research and Analysis

Keyword research was conducted to identify relevant search terms related to women's ethnic wear. Google Trends was used to explore search interest in India over the past five years. Different search terms were compared to understand their relative popularity and identify potential keyword opportunities for the Aarohi Ethnic Wear website.

The search terms "ethnic wear for women" and "women's ethnic wear" were compared using Google Trends. The comparison showed that "ethnic wear for women" generally had higher relative search interest during the selected period. The term "ethnic wear in Bengaluru" was also explored, but Google Trends did not provide sufficient data for this query.

Based on the keyword research and the purpose of each website page, relevant target keywords were mapped to the main pages of Aarohi Ethnic Wear. This helped establish a clear keyword focus for each page and guided the on-page SEO optimisation process.

### Table 1: Page-wise Keyword Mapping for Aarohi Ethnic Wear

| Website Page | Target Keyword |
|---|---|
| Home | Ethnic wear for women in Bengaluru |
| Sarees | Sarees for women in Bengaluru |
| Kurtis | Kurtis for women in Bengaluru |
| Dresses | Ethnic dresses for women in Bengaluru |
| Lehengas | Lehengas for women in Bengaluru |
| About | About Aarohi Ethnic Wear |
| Blog | Ethnic wear styling tips |
| Contact | Contact Aarohi Ethnic Wear |

Google Trends also showed rising interest in queries such as “mul cotton sarees” and “short kurti for women”. These terms were identified as potential keyword opportunities for the Sarees and Kurtis sections respectively. The findings suggest possible areas for future content development. However, rising interest in Google Trends does not confirm actual search volume or website traffic.

## Competitor SEO Analysis

### Table 2: Biba Website Competitor Analysis

| Analysis Area | Observation |
|---|---|
| Competitor | Biba |
| Website | https://www.biba.in/ |
| Product categories | Straight Suit Sets, Classic Kurtas, Dresses, Coord sets, Bottom Wear and Anarkali Sets |
| Keyword approach | Uses product and category-related search phrases |
| Website structure | Organises products into separate categories and collections |
| Learning for Aarohi | Create clear page categories and use relevant keywords for each page |

## Table 3: Libas Website Competitor Analysis

| Analysis Area | Observation |
|---|---|
| Competitor | Libas |
| Website | https://www.libas.in/ |
| Product categories | Suits, Kurtas, Sarees, Dresses, Jewellery, Loungewear, Plus Size, shirts and Bottoms |
| Homepage observation | Offers are displayed prominently near the beginning |
| Website structure | Products are organised into separate categories |
| Learning for Aarohi | Organise product pages clearly and consider different customer needs when planning content |

## Table 4: Manyavar Website Competitor Analysis

| Analysis Area | Observation |
|---|---|
| Competitor | Manyavar |
| Website | https://www.manyavar.com/ |
| Product categories | Sherwani, Indo-Western, Lehenga, Jodhpuri, Stitched Suit, Kurta Jacket Set, Sarees, Kurta Set, Anarkali Set, Women's Indo-Western and Kids Wear |
| Occasion-based collections | Wedding, Reception, Engagement, Sangeet, Haldi and Mehandi, Festive and Cocktail |
| Target audience | Men, women and children |
| Website structure | Products are organised by clothing type and occasion |
| Learning for Aarohi | Consider occasion-based content and organise website categories around customer search needs |

The competitor analysis of Biba, Libas and Manyavar showed the established ethnic wear brands organise their website using product categories and collections. Biba focuses on categories such as kurtas, suit sets and Anarkali sets. Libas offers a wider range of categories, including sarees, dresses, jewellery and plus size clothing. Manyavar organises its collections by product type and occasions such as weddings, receptions and festivals. These observations helped identify opportunities to improve category organisation and plan relevant content for Aarohi Ethnic Wear.

## On-Page SEO Optimisation

On-page SEO optimisation was performed on the Aarohi Ethnic Wear website to improve the relevance and structure of its web pages. The optimisation focused on page titles, meta descriptions, heading tags and website content. Relevant keywords were incorporated into suitable page elements to establish a clear topic for each page.

### Page Title Optimisation

Page titles were reviewed and optimised across the main website pages. Relevant keywords and the brand name were included to make each title descriptive and relevant to its page content. For example, the homepage title was updated to “Aarohi Ethnic Wear | Women’s Ethnic Wear in Bengaluru”.

### Meta Description Optimisation

Meta descriptions were reviewed and updated across the main website pages to provide clear summaries of their content. Relevant keywords and descriptive wording were included to make each page more informative for users. For example, the homepage meta description was updated to “Shop sarees, kurtis, ethnic dresses and lehengas at Aarohi Ethnic Wear in Bengaluru”.

### Heading Tag Optimisation

Heading tags were reviewed and organised across the website pages to improve content structure. Relevant H1, H2 and H3 headings were used to establish a clear hierarchy and make the page content easier to understand. The headings were also aligned with the topic and purpose of each webpage.

### Website Content Optimisation

Website content was reviewed and improved to make the information clearer and more relevant to each page.  Relevant keywords were incorporated naturally into the content without unnecessary repetition. The sarees page content was also simplified to improve readability and make it easier for visitors to understand.

### Internal Linking

Internal navigation links were reviewed to improve movement between the website pages. The Home navigation link was corrected to point to the main Aarohi Ethnic Wear homepage URL. This helped maintain consistent navigation and ensured that visitors could access the correct homepage.

### Image SEO

Image SEO was not implemented as part of this project because the practice website did not contain actual product images. Image optimisation, including descriptive file names and alternative text (alt text), was identified as an area for future improvement if images are added.

## Technical SEO Optimisation

Technical SEO was performed on the Aarohi Ethnic Wear website to improve its crawlability, indexing and website structure. The work included reviewing URL

structure, implementing canonical tags, checking website accessibility for search engines and preparing an XML sitemap and robots.txt file.

### Canonical Tags

Canonical tags were added to the main website pages to indicate their preferred URLs to search engines. The homepage canonical tag was configured to point to https://pramyashree444.github.io/aarohi-ethnic-wear/. This helped establish a preferred URL and reduce potential URL duplication issues.

### Robots.txt and Crawlability

A robots.txt file was created for the website to provide crawling instructions to search engines. The file allows all user-agent crawlers to access the website and includes the XML sitemap URL. This helps search engines discover the sitemap location and access the website pages for crawling.

### XML Sitemap

An XML sitemap was created for the Aarohi Ethnic Wear website, containing URLs of its eight main pages. The sitemap was submitted through Google Search Console to help Google discover the website pages. However, Google Search Console continued to display a “Couldn’t fetch” status. The sitemap opened successfully in a browser and returned an HTTP 200 response during external testing, but the sitemap fetching issue in Google Search Console remained unresolved.

### URL Structure and Crawl Audit

Screaming Frog SEO Spider was used to crawl the Aarohi Ethnic Wear website and review its URL structure and technical SEO elements. The crawl identified nine URLs, all returning successful HTTP 2xx status codes. No client errors (4xx) or missing canonical tags were detected in the final crawl. The audit also helped review page titles, meta descriptions and website readability.

### Mobile-Friendly and HTTPS Checks

Google PageSpeed Insights was used to evaluate the website on both mobile and desktop devices. The assessment covered Performance, Accessibility, Best Practices and SEO. In the latest recorded test, Performance scored 92 on mobile and 100 on desktop, while the other three categories scored 100 on both devices.

### HTTPS Verification

The HTTPS report in Google Search Console was reviewed to check the website's secure URL status. The report showed HTTPS URLs and no non-HTTPS URLs in the recorded results. This indicated that the website was being accessed through a secure connection during the review.

## Off-Page SEO and Backlinks Analysis

Ahrefs Free Backlink Checker was used to examine the backlink profile to the Aarohi Ethnic Wear website. The tool reported zero backlinks and zero linking websites in its index for the checked URL. This indicated that no backlinks were identified by the tool during the analysis. Building relevant backlinks was therefore identified as an area for future off-page SEO improvement.

Off-page SEO activities were not implemented for this practice website. Potential future activities include earning backlinks from relevant fashion websites and blogs, building genuine brand mentions and creating useful content that can attract references from other websites. These activities may help improve website authority and online visibility over time.

## Local SEO Optimisation

Local SEO practices were explored by incorporating location-specific keywords related to Bengaluru into the website's page titles, meta descriptions and keyword mapping. Terms such as "ethnic wear for women in Bengaluru" and "sarees for women in Bengaluru" were selected to establish a local search focus for the practice website. However, a Google Business Profile was not created because Aarohi Ethnic Wear is a fictional practice brand.

Google Business Profile optimisation factors were explored as part of the Local SEO learning process. These included selecting relevant business categories, writing an informative business description, managing genuine customer reviews and uploading quality business photographs. Profile creation and optimisation were not implemented because Aarohi Ethnic Wear is a fictional practice brand.

## Website Performance Analysis

Website performance analysis was conducted using Google PageSpeed Insights to evaluate the loading speed, responsiveness and overall performance of the Aarohi Ethnic Wear website. Both mobile and desktop versions were tested to identify performance-related issues and assess the website's user experience.

### PageSpeed Performance Results

Google PageSpeed Insights showed a Performance score of 92 on mobile and 100 on desktop. Accessibility, Best Practices and SEO scored 100 on both devices. These results indicated strong technical performance in the recorded assessment. In the latest test conducted on 04 November 2026, mobile results showed an FCP of 2.6 seconds, LCP of 2.6 seconds, TBT of 0 milliseconds, CLS of 0 and Speed Index of 3.1 seconds. Desktop results showed an FCP of 0.2 seconds, LCP of 0.2 seconds, TBT of 50 milliseconds, CLS of 0 and Speed Index of 0.3 seconds.

## Mobile and Desktop Performance Comparison

The latest PageSpeed test showed that desktop loading performance was faster than mobile. Desktop recorded an FCP of 0.2 seconds, LCP of 0.2 seconds and Speed Index of 0.3 seconds, while mobile recorded an FCP of 2.6 seconds, LCP of 2.6 seconds and Speed Index of 3.1 seconds. Total blocking time was 50 milliseconds on desktop and 0 milliseconds on mobile. Both devices recorded a Cumulative Layout Shift (CLS) of 0. These results indicate that the website loaded faster on desktop, while mobile performance could be improved further.

## Findings

An earlier mobile Lighthouse diagnostic identified a critical request chain involving the homepage HTML document and its CSS stylesheet. It also highlighted a render-blocking CSS request, a short cache lifetime and opportunities to review CSS loading and browser caching. These findings indicate areas where website performance could be improved further.

## Core Web Vitals and Field Data

PageSpeed Insights did not provide sufficient real-user field data to display a Core Web Vitals assessment for the website. Therefore, performance was evaluated using Lighthouse lab data for mobile and desktop devices.

## Performance Analysis and Observations

The website achieved a mobile performance score of 92 and a desktop performance score of 100. Desktop loading performance was significantly faster than mobile. Both devices showed zero Cumulative Layout Shift, indicating a stable page layout. Total Blocking Time was also very low on both devices. The mobile First Contentful Paint and Largest Contentful Paint were slower than desktop, indicating an opportunity for further mobile loading optimisation.

### Performance Recommendations

Although the website achieved good performance scores, mobile loading speed can be improved further. Future optimisation may include reviewing render-blocking resources, reducing unnecessary JavaScript, and improving the delivery of critical page content. Any changes should be tested to ensure they do not affect website functionality or tracking.

## Google Analytics 4 (GA4) Implementation

Google Analytics 4 (GA4) was implemented on the Aarohi Ethnic Wear website to monitor website traffic and user interactions. The Google tag (gtag.js) was added to the HTML code of the website within the head section. The GA4 measurement ID used for this implementation was G-NXVKVWD22H, which was configured to connect the website with the Google Analytics property.

### GA4 Tracking Verification

After implementing GA4, the tracking setup was tested using the Realtime report. The website was opened and refreshed to generate a test visit. The Realtime report successfully detected one active user and displayed the page_view and session_start events. This confirmed that basic website activity was being received by Google Analytics.

### Traffic Acquisition Analysis

The GA4 Traffic Acquisition report was used to understand how visitors reached the website. During the reporting period, the website recorded 5 sessions and 3 engaged sessions, with an engagement rate of 60%. All recorded sessions were attributed to Direct traffic. Organic Search recorded zero sessions during this period. The data also included visits generated during personal website testing.

Since this was a fictional practice website, the recorded traffic mainly reflected testing and personal visits. These figures should not be interpreted as actual customer traffic.

| Metric | Result |
|---|---|
| Total sessions | 5 |
| Engaged sessions | 3 |
| Engagement rate | 60% |
| Average engagement time | 1 min 7 sec |
| Events | 103 |
| Events per session | 20.60 |
| Organic Search sessions | 0 |

### Landing Page Analysis

The GA4 Landing Page report was analysed to identify the pages through which visitors entered the website. During the reporting period, 26 September to 23 October 2026, the website recorded 5 sessions and 2 active users. The homepage received the highest number of sessions. The About and Sarees pages also received visits.

| Landing page | Sessions | Average engagement time |
|---|---|---|
| Homepage | 2 | 1 min 4 sec |
| (not set) | 1 | 0 sec |
| About page | 1 | 3 min 17 sec |
| Sarees page | 1 | 14 sec |

**Additional findings**

- Key events: 0
- Total revenue: 0

### Data Limitations

Since Aarohi Ethnic Wear is a fictional practice website, the available GA4 data is limited. Most recorded activity was generated during website testing rather than from actual customers. The small sample size may not represent genuine user behaviour. No key events or revenue were recorded during the analysed period. Therefore, the GA4 findings are used for learning and practical analysis rather than business performance evaluation.

## Issues Identified and Recommendations

### Issues Identified During the SEO Audit

During the SEO audit of the Aarohi Ethnic Wear website, several areas requiring improvement were identified using SEO tools. These included  page title and meta description optimisation, canonical URL configuration, internal linking improvements and content quality. The identified issues were reviewed and corrections were implemented wherever necessary.

### Issues, Corrective Actions and Status

| Issues identified | Corrective action | Status |
|---|---|---|
| Short page titles on some pages | Updated page titles to improve relevance and descriptive value. | Completed |
| Missing meta descriptions on some pages | Added relevant meta descriptions to the affected pages. | Completed |
| Missing canonical tag on homepage | Added a canonical URL pointing to the preferred homepage URL. | Completed |

| | | |
|---|---|---|
| Incorrect internal homepage link | Corrected the misspelled website URL in the Home navigation link. | Completed |
| Duplicate homepage titles across homepage URL and index.html | Added a canonical tag to indicate the preferred homepage URL. | Canonical added; duplicate URL handling should be monitored |
| Low text content across several pages | Identified during the crawl; the website remains a fictional practice project with limited content. | Identified; future content improvement recommended |

### Recommendations for Improvement

Based on the SEO audit and performance analysis, the following improvements are recommended to maintain and enhance website quality.

1. **Improve Mobile Performance:** Review CSS loading and browser caching to improve mobile page speed.
2. **Monitor Indexing:** Regularly check Google Search Console for sitemap status, indexing issues and page visibility.
3. **Improve Website Content:** Add useful, original and relevant content to pages with limited text when the website develops beyond the practice stage.
4. **Monitor Technical SEO:** Check canonical tags and duplicate homepage URL handling regularly.
5. **Track Website Activity:** Continue monitoring GA4 reports to understand website visits, user engagement and traffic sources.

## Conclusion

The Aarohi Ethnic Wear project provided practical experience in implementing Search Engine Optimisation techniques on a website. Through this project, various SEO tools and platforms were used to analyse website structure, identify technical issues, improve on-page elements, monitor indexing and evaluate website performance. Google Search Console and Google Analytics 4 were also used to understand search visibility and website activity. The project helped develop practical knowledge of SEO auditing, website optimisation, performance analysis and digital marketing tools. Although the website was created for practice purposes, the experience provided a foundation for applying SEO techniques to real-world websites.
